

Palladium Wood Products

Our purpose at Palladium Wood Products is to manufacture and market equine containment products that solve ALL fencing issues that face concerned horse owners.

We identified five issues that we feel important to most every owner:

- 1). Safety & Security.** Simply put, the #1 reason for our existence. Properly installed, Palladium is absolutely the safest and most secure fencing system on the market today. We combine the strength of pressure-treated wood (security) with a polymer exterior coating (safety) that eliminates the shortcomings of a traditional wood fence. Palladium maximizes the latest polymer technology to eliminate splintering, the danger of wood breaks and in most cases, cribbing or chewing.
- 2). Longevity.** The Palladium system combines a superior design with quality materials and workmanship. We offer a 20-year replacement warranty on all our products. Additionally, the polymer used in the Palladium process is far superior to that found in hollow-vinyl fencing. We utilize polyethylene which is a superior performer in extreme climates. Extreme heat does not cause Palladium to sag and extreme cold does not cause it to get brittle. Palladium will perform on your farm or ranch for decades with proper installation.
- 3). Maintenance.** Our smooth, exterior polymer coating makes Palladium an extremely low-maintenance product. There are no fencing products that are absolutely maintenance-free. Pressure-washing or cleaning with a water/bleach mixture every few years, keeps Palladium looking as new as the day it was installed.
- 4). Economic.** Palladium is a premium equine fencing product and simply has a higher up-front cost than many other lesser fencing products. However, the attributes of our system combined with Palladium's performance life-expectancy, make it the most economically-efficient fencing alternative on today's market. No other fencing product can make this claim.
- 5). Environment.** The chemicals used in pressure-treating wood products have received much public and government scrutiny over the last years. The use of creosote as a preservative is banned in many markets and the use of preservatives that contain arsenic are banned throughout the United States. Palladium, utilizes only environmentally-safe treating chemicals in our wood cores. Additionally, our cap system eliminates the leaching of any chemicals into the soil, water or air.
